STRATEGIC CAPITAL PORTAL

FARMSENSE SEED ROUND A-1

Executive Summary

DOCUMENT TYPE	CLASSIFICATION	DATE
Investor Material	CONFIDENTIAL	March 11, 2026

Executive Summary

FarmSense Seed Round A-1

Founder: Jeremy Beebe — Successful startup exit with Hempvada

Company: Bxthre3 Inc.

Product: FarmSense™ — Deterministic Farming Operating System (DFOS)

Classification: CONFIDENTIAL

The $500/AF Catalyst

The Rio Grande Basin faces a severe hydro-economic crisis that makes FarmSense a **legal necessity**, not just an optimization tool:

Factor	Status
Annual aquifer depletion	89,000 acre-feet
Groundwater pumping fee	**$500/AF** (quadrupled from $75-150/AF)
Reservoir storage	26% of historical capacity
Irrigated agriculture	300,000 acres at risk

Economic Impact for a 126-acre pivot:

20% water reduction = 50.4 AF saved per season

50.4 AF × $500/AF = **$25,200 direct savings annually**

FarmSense Enterprise subscription: $499/month ($5,988/year)

First-year ROI: 421% return on subscription cost

The Deterministic Paradigm

FarmSense replaces stochastic, intuition-based agriculture with a high-fidelity computational engine.

Dimension	Current Industry Standard	FarmSense DFOS
Observation	Visual scouting / manual soil probe	1m centimetric Kriging + ground-truth validation
Calculation	Crop-coefficient (static, FAO-56)	SPAC thermodynamics (dynamic, real-time)
Decision	Intuition-based pumping schedules	Edge-calculated VRI prescription
Evidence	Paper logs, human memory	SHA-256 sovereign ledger, cryptographic proofs
Resolution	Field-scale (variable)	1m grid, legally admissible

Market Opportunity

TAM/SAM/SOM Analysis

Market Tier	Size	Definition
TAM	$12.8B by 2030	Global precision irrigation market (14.3% CAGR)
SAM	$1.05B/year	North American center-pivot SaaS potential
SOM	$7.7M/year	SLV Subdistrict 1 immediate opportunity (1,280 fields)

Competitive Moat: Why We're Defensible

Competitor Comparison

Competitor	Approach	Their Weakness	Our Advantage
CropX	Cloud-only analytics	Latency, connectivity dependency	Edge autonomy + sovereign ledger
FieldNET	Pivot control only	No soil moisture, no VRI	Full SPAC modeling + 1m VRI prescriptions
Arable	Weather-only	No ground-truth correlation	Sensor fusion + satellite validation
Sat-only providers	Trend analysis	No deep-profile validation	1m Kriging + 48" VFA anchors

Moat Durability

Data Moat: 4+ years of ground-truth calibration per field creates network effects

Regulatory Moat: Legal recognition as "approved monitoring method" (SLV 2026 Water Court)

Technical Moat: Sensor-agnostic architecture fuses satellite trends with sub-surface realities

Network Moat: 1,280-field mesh effects improve interpolative accuracy

Core Capabilities

Capability	Description
Satellite Integration	Multi-spectral imagery from Sentinel, Landsat, commercial providers
IoT Sensor Suite	LRZ scouts, VFA anchors, PMT hubs, DHU regional managers
Water Ledger	Cryptographically signed chain of custody — Water Court admissible
Adaptive Recalculation	Deterministic algorithms: Dormant, Anticipatory, Ripple, Collapse modes
Regulatory Compliance	Built for SLV 2026 Water Court requirements

Capability	Description
Economic Intelligence	Continuous cost-benefit analysis per field

Hardware Ecosystem: Tri-Layer Architecture

Tier	Device	Function	Compute
Regional	RSS (40ft container)	Territory master, blackout-proof	64-core Threadripper, 50TB NVMe
District	DHU (35ft pole)	100-pivot mesh manager, 30-day cache	Jetson Orin, 128GB PSLC SSD
Field	PMT (pivot-mounted)	Edge aggregator, 50m Kriging	ESP32-S3, IMU, LoRa gateway
Sensors	VFA/LRZ1/LRZ2/PFA	Ground-truth collection	nRF52840, AES-256, 4+ yr battery

Key Metrics

Metric	Target
Water Reduction	20-30%
ROI Increase	18-22%
Grid Resolution	50m → 1m (400x improvement)
Pilot Deployment	SLV 2026 (2 fields active)
Legal Validation	June 29, 2026 Water Court

Development Timeline

Phase	Date	Milestone
Now — June 2026	Active	CSU San Luis Valley 2-Field Pilot
March 26, 2026	Fund Raising	Federal ESG Pre-Proposal Deadline
June 2026	Evidence	SLV Subdistrict 1 Water Court Submission
Q3-Q4 2026	Scale	Regional Master — 100% SLV Subdistrict 1
2027	Standard	Colorado DWR Adoption
2028	Expansion	Colorado River Basin (4M acres)

The Ask: Seed Round A-1

Seeking: $3M Seed Round

Valuation: $8-10M pre-money

Use of Funds:

40% Hardware prototype manufacturing

25% Field operations team (CSU pilot)

20% Software / Kriging engine refinement
10% Regulatory / Water Court preparation
5% Reserve

Non-Dilutive Pipeline: $12M-$25M federal grants (USDA SBIR, NRCS CIG, DOE, NSF, Gates Foundation)

Risk Factors

Risk	Mitigation
Regulatory delay	Multi-state expansion pipeline (CO, AZ, CA, TX)
Hardware supply chain	Dual-source strategy, domestic alternatives
Competition	Legal moat + data network effects
Climate variability	40 global basins reduce geographic concentration

Long-Term Vision: Sovereign Water Infrastructure

FarmSense will become the **standard data substrate** for agricultural water management across North America and beyond. From SLV's 1,280 fields to the Colorado River Basin's 4M acres to the High Plains Aquifer's 15M acres — deterministic water intelligence with cryptographic chain of custody.

The shift: From "How much can we grow?" to "How little can we use?"
